

UDACITY FORUM APP

Basic idea

The idea is to create a forum application that enables a user to ask questions and anyone from the community can help him. The helper will receive reputation points and thus helpers can also have an incentive for helping. It provides not only a way to spread and update your knowledge among community, but also provides you with future prospects if you get enough reputations. Basically it is just like any community app like quora, stack etc. But what makes it different is that we will build it by taking udacity forum in mind. The look and feel of the app should help a user easily recognize that it's udacity.

Basic motivation for this app

The moment I enrolled in this course, the first thing that I found really awesome was udacity forum. But it always felt a little empty that we don't have an app for it. I know many of you felt the same way. So, I request you to come with me and let's build what we liked.

Technologies Used

- PHP and MYSQL for ANDROID
- Content providers
- AsyncTasks and Loaders
- Android architecture components
- SQLITE or ROOM database
- Material design elements
- Services & Broadcast Receivers
- Other android specific technologies

Features

- User will be able to ask questions
- Anyone can reply to that questions (basically a whatsapp group like chat system for comments)
- user can upload images to improve questions
- A code formatter will be included
- Adding Multi-Language Support
- Users will be able to read previous questions in offline mode.

Basically we will try to add everything that we see in udacity forum website one by one.

We ask everyone who love udacity to contribute in this app. For any doubts/queries, just reply with your query at [cp_forums_app](#) .

Thank you
